# Insights, Predictions, and Actions

Descriptive Definitions of Data Science,  
Machine Learning, and Artificial Intelligence

Andrew Flack

# The terms “Data Science,” “Machine Learning,” and “Artificial Intelligence” are increasingly common.

**DoD must stay on the cutting edge in technology, culture, operations, and processes.**

Defense Innovation Advisory Board

**Recommendation 5: Catalyze Innovations in Artificial Intelligence and Machine Learning**

# “Textbook” definitions are not terribly helpful.

## A GLOSSARY OF ARTIFICIAL-INTELLIGENCE TERMS

- **ARTIFICIAL INTELLIGENCE**

AI is the broadest term, applying to any technique that enables computers to mimic human intelligence, using logic, if-then rules, decision trees, and machine learning (including deep learning).

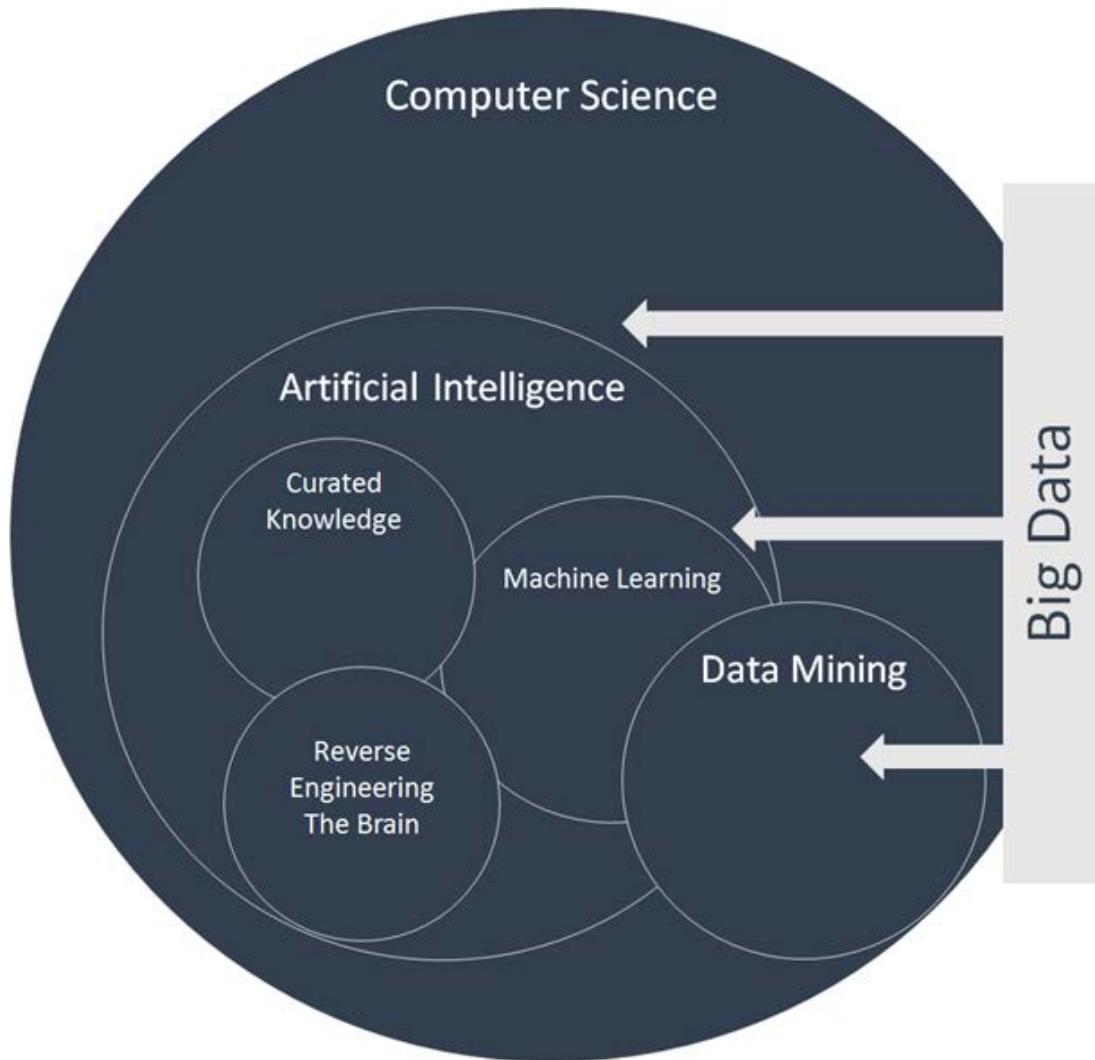

- **MACHINE LEARNING**

The subset of AI that includes abstruse statistical techniques that enable machines to improve at tasks with experience. The category includes deep learning.

- **DEEP LEARNING**

The subset of machine learning composed of algorithms that permit software to train itself to perform tasks, like speech and image recognition, by exposing multilayered neural networks to vast amounts of data.

# Textbook definitions are not terribly helpful.

# Is it just marketing?

Baron Schwartz

# Forget the formal definitions and hierarchies.

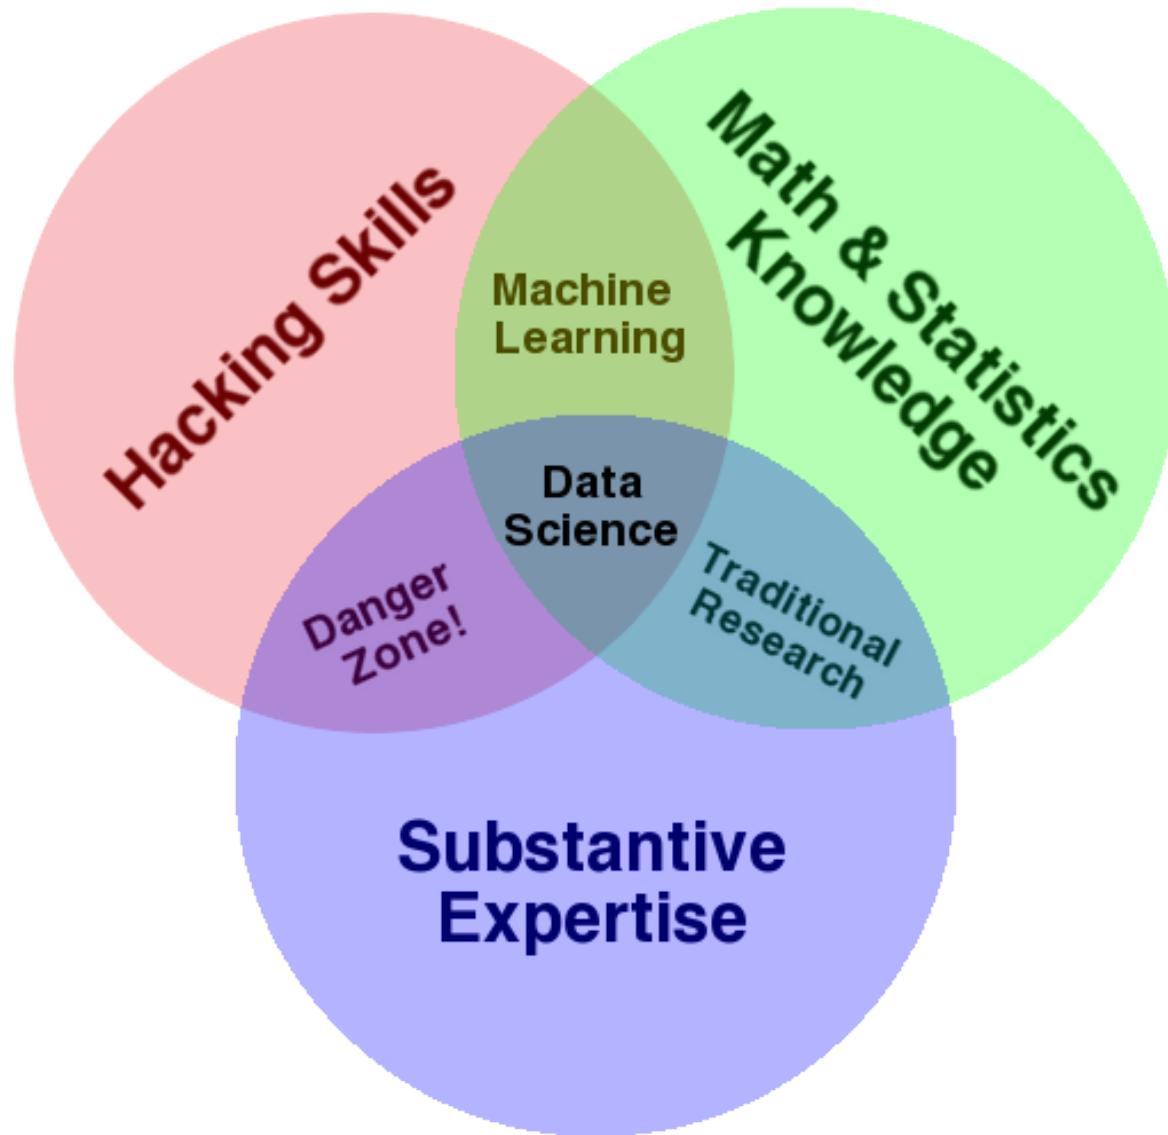

What does a practitioner in  
each discipline actually *do*?

Data Science Produces Insights  
Machine Learning Makes Predictions  
Artificial Intelligence Produces Actions

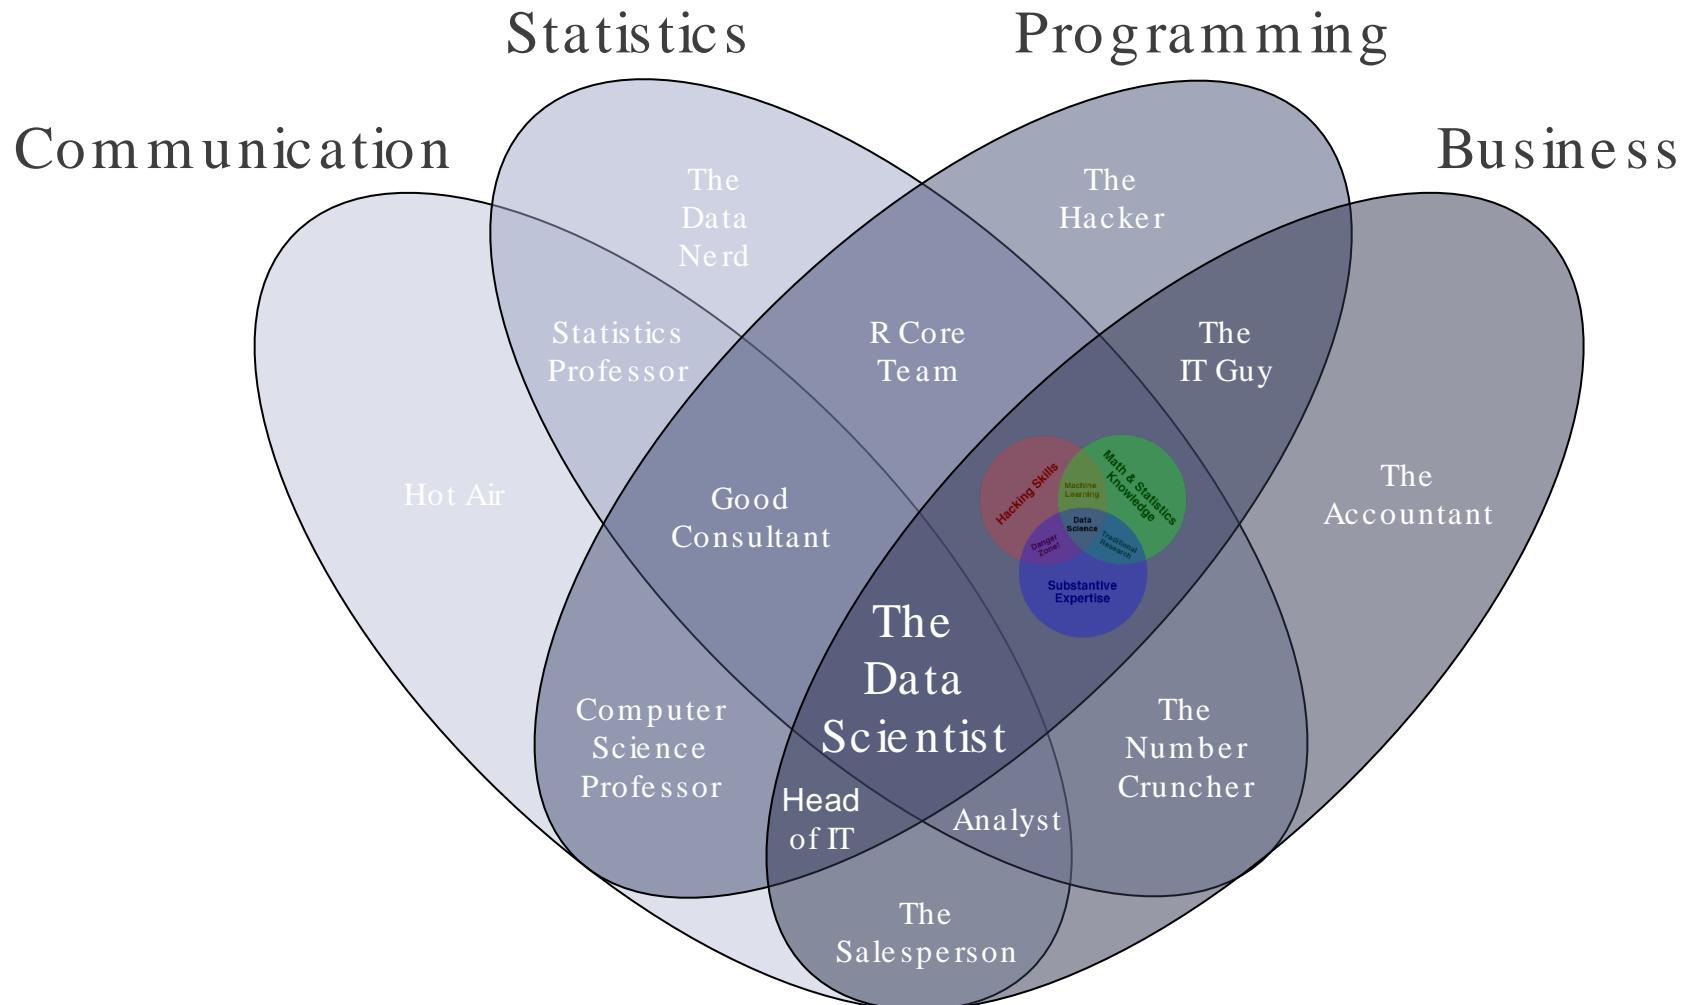

**Data science is the process of obtaining, transforming, analyzing, and communicating data to answer a question.**

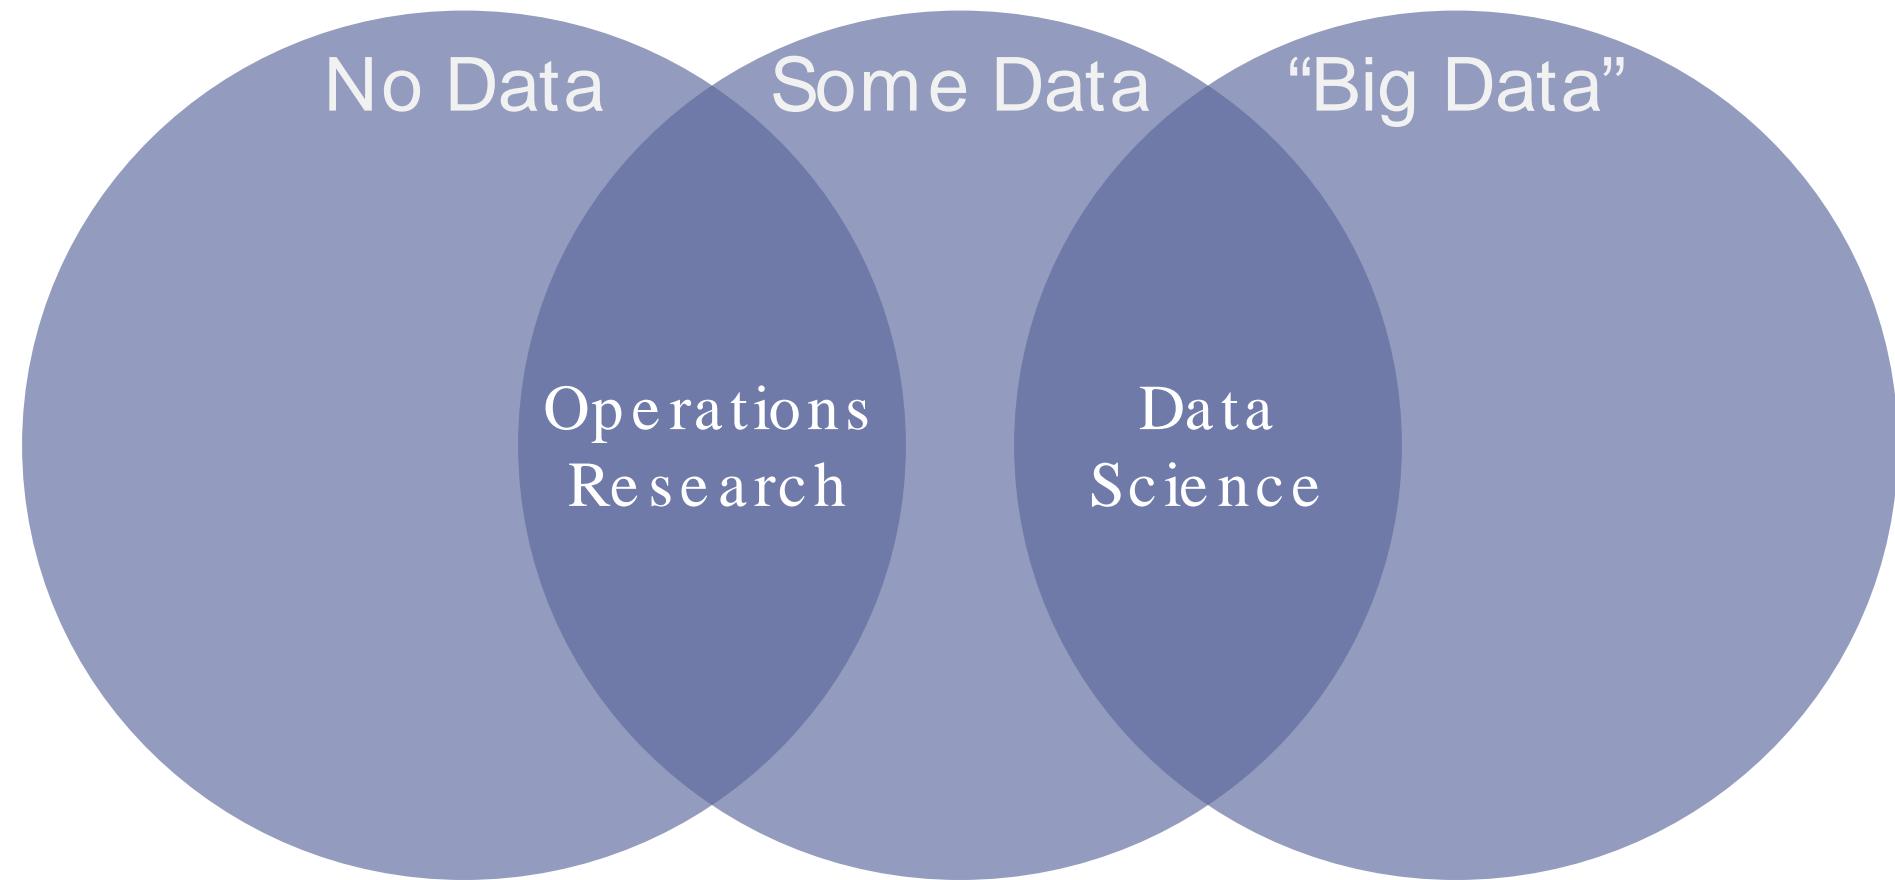

# Who is a data scientist?

# Who is a data scientist?

# Isn't this just an Operations Research / Systems Analyst (ORSA)? Not quite ...

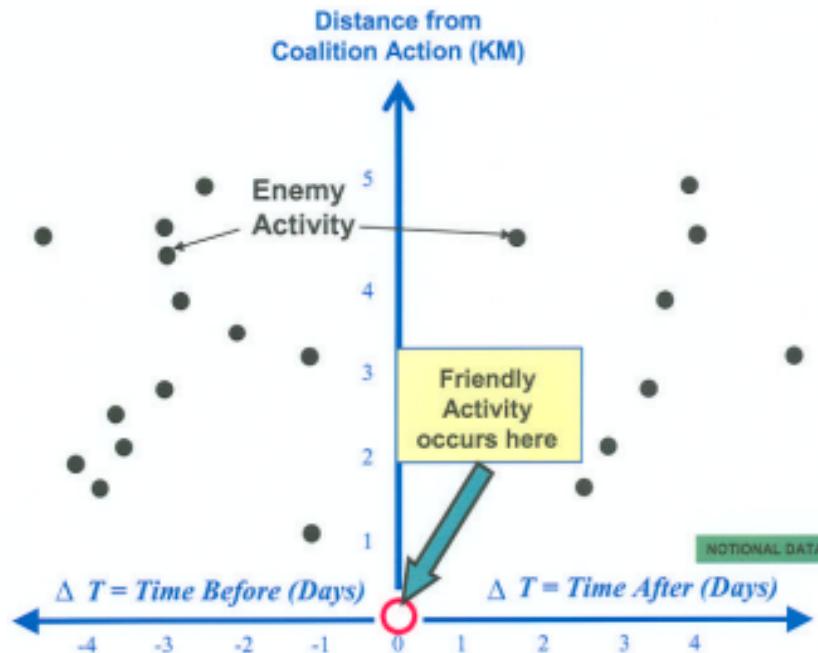

# “Data Science” in Defense

*Is this friendly activity (cordon and search, raid, road block, etc.) reducing enemy activity?*

Compare the number of enemy events, before and after a friendly activity, to see if there is a significant difference.

# Data Science in Defense

The friendly activity indicated here could be "militia disarmed" or "curfew emplaced" or "presence patrol", as long as a database exists from which to draw these friendly and enemy events.

Results indicate not only how effective friendly activity is at reducing enemy activity, but also the distance in space and time that it remains effective.

# Data Science in the wild

Who are the most profitable customers?

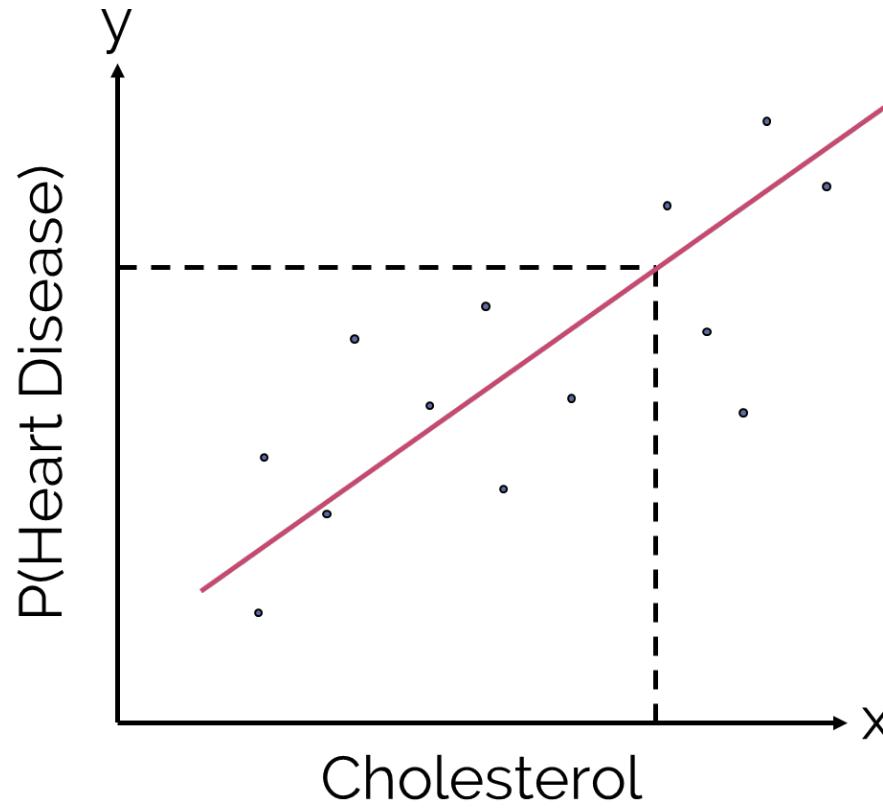

Is there really a difference between profitable customers  
and the average customer?

Can I characterize customers in some way?

Data Science Produces Insights  
Machine Learning Makes Predictions  
Artificial Intelligence Produces Actions

Discover a function  $y=f(x)$  that best predicts the value of  $y$  associated with each value of  $x$ .

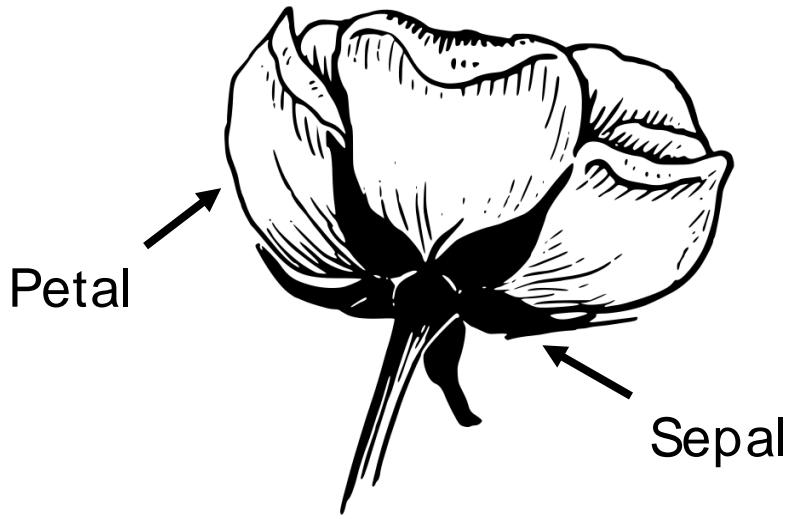

If the response variable is numeric, we're doing regression.\*

\* In this context, we're using regression to PREDICT, not to EXPLAIN.

If the response is categorical, it is a classification task.

MEMORANDUM FOR: SEE DISTRIBUTION

SUBJECT: Establishment of an Algorithmic Warfare Cross-Functional Team (Project Maven)

As numerous studies have made clear, the Department of Defense (DoD) must integrate artificial intelligence and machine learning more effectively across operations to maintain advantages over increasingly capable adversaries and competitors. Although we have taken tentative steps to explore the potential of artificial intelligence, big data, and deep learning, I remain convinced that we need to do much more, and move much faster, across DoD to take advantage of recent and future advances in these critical areas.

Accordingly, I am establishing the Algorithmic Warfare Cross-Functional Team (AWCFT) to accelerate DoD's integration of big data and machine learning. The AWCFT's objective is to turn the enormous volume of data available to DoD into actionable intelligence and insights at speed.

The AWCFT's first task is to field technology to augment or automate Processing, Exploitation, and Dissemination (PED) for tactical Unmanned Aerial System (UAS) and Mid-Altitude Full-Motion Video (FMV) in support of the Defeat-ISIS campaign. This will help to reduce the human factors burden of FMV analysis, increase actionable intelligence, and enhance military decision-making. AWCFT will: 1) organize a data-labeling effort, and develop, acquire, and/or modify algorithms to accomplish key tasks; 2) identify required computational resources

# Machine Learning in Defense

*“..augment or automate Processing, Exploitation, and Dissemination (PED) for tactical Unmanned Aerial System (UAS) and Mid-Altitude Full-Motion Video (FMV) ...”*

*“38 classes of objects the department needs to detect”*

**TARGET**

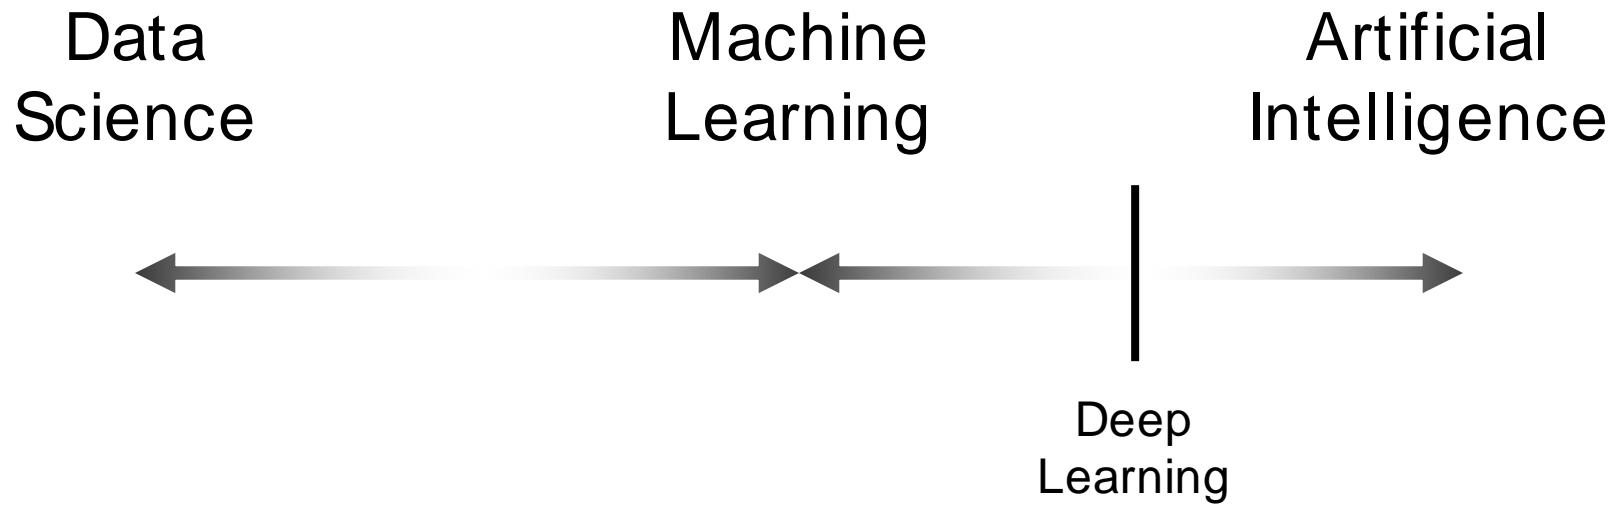

Data Science Produces Insights  
Machine Learning Makes Predictions  
Artificial Intelligence Produces Actions

Rather than teaching computers how to do everything,  
teach them to learn for themselves.

Arthur Samuel, a pioneer in Artificial Intelligence, created  
a program to play checkers.

*He was the first to develop a machine that surpassed his  
ability in a task that he taught it.*

# Again, separation between these disciplines is blurry.

### Mastering the game of Go without human knowledge

David Silver<sup>1\*</sup>, Julian Schrittwieser<sup>1\*</sup>, Karen Simonyan<sup>1\*</sup>, Ioannis Antonoglou<sup>1</sup>, Aja Huang<sup>1</sup>, Arthur Guez<sup>1</sup>, Thomas Hubert<sup>1</sup>, Lucas Baker<sup>1</sup>, Matthew Lai<sup>1</sup>, Adrian Bolton<sup>1</sup>, Yutian Chen<sup>1</sup>, Timothy Lillicrap<sup>1</sup>, Fan Hui<sup>1</sup>, Laurent Sifre<sup>1</sup>, George van den Driessche<sup>1</sup>, Thore Graepel<sup>1</sup> & Demis Hassabis<sup>1</sup>

A long-standing goal of artificial intelligence is an algorithm that learns, *tabula rasa*, superhuman proficiency in challenging domains. Recently, AlphaGo became the first program to defeat a world champion in the game of Go. The tree search in AlphaGo evaluated positions and selected moves using deep neural networks. These neural networks were trained by supervised learning from human expert moves, and by reinforcement learning from self-play. Here we introduce an algorithm based solely on reinforcement learning, without human data, guidance or domain knowledge beyond game rules. AlphaGo becomes its own teacher: a neural network is trained to predict AlphaGo's own move selections and also the winner of AlphaGo's games. This neural network improves the strength of the tree search, resulting in higher quality move selection and stronger self-play in the next iteration. Starting *tabula rasa*, our new program AlphaGo Zero achieved superhuman performance, winning 100–0 against the previously published, champion-defeating AlphaGo.
